

8/3/2006

When the EJ Davis Company presented us with the idea of using a combination insulation system utilizing both 6" of fiberglass and ESP Low-E reflective insulation we had a hard time believing this would work. We liked the idea of saving energy but the thin layer of material seemed unlikely to work and we were not totally convinced of the annual energy savings verses a fiberglass only system. After experiencing the system for a full year, in an environment of rising energy costs, we now know it was well worth the additional insulation cost and will pay for itself in a very short time. The utility usage is significantly less than our other building of the same size insulated using two 6" layers of fiberglass. You can really notice a higher comfort level in the new building with the Low-E insulation. The installers did an excellent job and the insulation looks great. We would highly recommend this insulation system to others considering the options and would not even consider constructing another building without the ESP Low-E insulation installed in it.
